

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A nail clipper comprising

a top elongated member having a top surface, a bottom surface, a pair of side surfaces connecting the top and bottom surfaces, and distal and proximal ends;

a bottom elongated member having a top surface, a bottom surface, a pair of side surfaces connecting the top and bottom surfaces, and distal and proximal ends;

a first post having a first end coupled to the top surface of the bottom elongated member adjacent the proximal end thereof and a second end located at a point above the top surface of the top elongated member, the post being located adjacent to and outwardly of a side surface of the top elongated member;

a second post having a first end and a second end, the first end of the second post being connected to the second end of the first post by a hinge;

each of the proximal ends of the top and bottom members having a cutting edge disposed in opposing nail clipping relationship;

a lever having a bottom surface coupled to the second end of the second post ~~at the point above the top surface of the top elongated member~~, the lever disposed and adapted to cause movement of the cutting edges between a cutting position and non-cutting position; and

a bumper disposed on the bottom surface of the bottom member, the bumper having an edge disposed distant from the proximal end of the bottom member, wherein the lever lacks a hole through which the post extends.

2 – 4 (Canceled).

5. (Original). A nail clipper according to claim 1, wherein the bumper extends from about the proximal end to said edge and has a generally triangular shape whose apex is distant from the bottom elongated member.

6. (Previously presented). A nail clipper according to claim 17, wherein said lever includes a thumb accepting depression.

7. (Previously presented). A nail clipper according to claim 6, wherein the cutting edges are disposed at an angle to a central longitudinal axis of the top and bottom elongated members.

8. (Previously presented). A nail clipper according to claim 1, wherein the cutting edges are disposed at an angle to a central longitudinal axis of the top and bottom elongated members.

9 – 15 (Canceled).

16. (Previously presented). A nail clipper according to claim 1, wherein the distal ends of the top and bottom elongated members are interconnected.

17. (Previously presented). A nail clipper according to claim 1, wherein the distal ends of the top and bottom elongated members are not interconnected.

18 – 19 (Canceled).

20. (Previously presented). A nail clipper according to claim 22, wherein the bumper extends from about the distal end to said edge and has a generally triangular shape whose apex is distant from the bottom elongated member.

21. (Canceled).

22. (Currently amended) A nail clipper comprising

- a top elongated members having a top surface, a bottom surface, a pair of side surfaces, and distal and proximal ends;
- a bottom elongated member having a top surface, a bottom surface, a pair of side surfaces connecting the top and bottom surfaces, and distal and proximal ends;
- the distal ends of the top and bottom elongated members not being interconnected;
- a first post having a first end coupled to the top surface of the bottom elongated member adjacent the proximal end thereof and a second end located at a point above the top surface of the top elongated member, the post abutting and interconnected to a side surface of the top elongated member;
- a second post having a first end and a second end, the first end of the second post being connected to the second end of the first post by a hinge;
- each of the proximal ends of the top and bottom members having a cutting edge disposed in opposing nail clipping relationship, wherein the cutting edges are disposed at an angle to the central longitudinal axis of the top and bottom elongated members;
- a lever having a bottom surface coupled to the second end of the second post ~~at the point above the top surface of the top elongated member~~, the lever disposed and adapted to cause movement of the cutting edges between a cutting position and non-cutting position, the lever including a thumb accepting depression; and

a bumper disposed on the bottom surface of the bottom member, the bumper having an edge disposed distant from the proximal end of the bottom member, wherein the lever lacks a hole through which the post extends.

23. (New) A nail clipper comprising
a top elongated member having a top surface, a bottom surface, and distal and proximal ends;
a bottom elongated member having a top surface, a bottom surface, and distal and proximal ends;
each of the proximal ends of the top and bottom members having a cutting edge;
a first post having a first end coupled to the bottom elongated member and a second end located above the top elongated member;
a second post having a first end and a second end, the first end of the second post being connected to the second end of the first post by a hinge; and
a lever having a bottom surface coupled to the second end of the second post, the lever disposed and adapted to cause movement of the cutting edges between a cutting position and non-cutting position.

24. (New) A nail clipper according to claim 23, further comprising a bumper disposed on a bottom surface of the bottom member, the bumper having an edge disposed distant from the proximal end of the bottom member.

25. (New). A nail clipper according to claim 24, wherein the bumper extends from about the proximal end to said edge and has a generally triangular shape whose apex is distant from the bottom elongated member.

26. (New). A nail clipper according to claim 23, wherein said lever includes a thumb accepting depression.

27. (New). A nail clipper according to claim 23, wherein the cutting edges are disposed at an angle to a central longitudinal axis of the top and bottom elongated members.

28. (New). A nail clipper according to claim 23, wherein the distal ends of the top and bottom elongated members are interconnected.

29. (New). A nail clipper according to claim 23, wherein the distal ends of the top and bottom elongated members are not interconnected.
